

KOBUSHI MULTIMEDIA

MPEG Issues

POSTED - 02/11/99

IMPORTANT NOTE:

32-bit MPEG Drivers for Win9x (and higher) and WinNT (4.0 and higher) are outdated on many older CD-ROM titles authored by Kobushi Multimedia. If your CD has ActiveMovie Drivers or DirectMedia 5.0 Drivers, you should not install them.

Instead download the latest DirectMedia6.0 Drivers that are used for Win9x (and higher) and WinNT (4.0 and higher) by clicking the link below.

<http://www.microsoft.com/windows/windowsmedia/default.msp>

(NOTE: If you are running Windows 98 Second Edition® (or higher), it already has MPEG playback ability and requires NO action or installation on user's part. Download this update only if you are having trouble with MPEG playback ability.)

16-bit MPEG Drivers (for old/slow machines) are current on each CD-ROM Kobushi Multimedia has in circulation. Install these only if 32-bit drivers produce poor playback. Unpredictable results with other applications can occur when using the supplied 16-bit MPEG drivers. We, therefore, only recommend them as a last result.

Download Drivers
